

THE NPD GROUP, INC.
CUSTOM & SYNDICATED RESEARCH

CONSUMER DISPOSAL OF HOUSEHOLD CLEANING PRODUCTS

MARCH, 1995

Prepared for:
The Soap and Detergent Association

NEW YORK: 900 West Shore Road, Port Washington, New York 11050-0402/516-625-0700

CHICAGO: 1300 West Higgins Road, Park Ridge, Illinois 60068-5798/708-692-6700

CINCINNATI: 250 East Fifth Street, Cincinnati, Ohio 45202/513-762-7627

HOUSTON: 820 Gessner, Suite 830, Houston, Texas 77024/713-464-5409

BACKGROUND & OBJECTIVES

Background and Objectives

The Soap and Detergent Association would like to determine whether or not consumers dispose of unused cleaning products and, if so, at what levels (incidence) this is occurring. More specifically, the objectives of this research are to determine:

- ◆ Whether or not consumers dispose of unused household cleaning products; that is, the products themselves, not just the package or container.
- ◆ If so, what is the incidence of households disposing of unused cleaning products?
- ◆ How and where are these products disposed?
- ◆ What kind of treatment system (septic or municipal) the products are disposed into?
- ◆ What product forms are disposed most often?

METHODOLOGY

Methodology

A full-page ((5 1/2" x 8") mail questionnaire was sent to a nationally representative sample of 20,000 households, utilizing the NPD monthly consumer omnibus, Insta-View.

The questionnaire covered:

- ◆ Types of products for which containers were disposed during the past three months
- ◆ For each product category in which the container was disposed, whether or not unused product was also disposed
- ◆ For each product type disposed, the method of disposal
- ◆ For each product type disposed, what was the product form

Product categories covered include three broad areas: laundry products, dishwashing products, and general household cleaning products. In total, 27 separate product categories were included on the questionnaire. A copy of the questionnaire used is appended.

The questionnaires were mailed during the first week of December, 1994, and the field period ended the first week of January, 1995. Total usable returns were 13,697, a return rate of 68.5%. Additional returns which were blank or which were filled out incorrectly are not included in this number.

The following tables show the tabulated data for this study. An explanation of the banner points (column headings) used is also included.

SUMMARY OF FINDINGS

Summary of Findings

- ◆ Overall, 8% of the households responding to this survey reported disposing of at least one unused cleaning product within the past 3 months.
 - ◆ Among the 8% of households which did dispose of a product, the average number of products disposed was 2.43. This suggests that a few households are disposing of a number of products while most households do not dispose of products at all.
 - ◆ Respondents who rent their residence are significantly* more likely to have disposed of products (10%) than those who own their homes (7%); it is possible that renters are more mobile than home-owners and, therefore have more occasion to discard unused product. According to U.S. Census data, 4.5% of households move in an average 3-month period; however, renters move 3.6 times more often than home-owners (on an annual basis).
 - ◆ Younger people are significantly* more likely to have disposed of products than are older people; 11% of those under 35 had disposed of one or more products compared with only 6% of those over 55.
 - ◆ There was no difference in levels of product disposal between those who have septic tank systems and those on municipal sewer systems; 7% of those with septic tank systems and 8% of those on sewer systems disposed of products. However, among those who did not know or did not report what type of system they have, 11% disposed of product(s).
 - ◆ There were some regional differences, with households in the South significantly* more likely to dispose of unused product than those in the Central or West regions. Households in the East disposed of products at a slightly, but not significantly, higher rate than those in the Central or West region.

*Significant at the 90% confidence level.

- ◆ The product form most often disposed of was liquids in bottles, with 3.2% of the total sample reporting that they disposed of a product in this form. Aerosols were next, with 1.0% of total households disposing of a product in this form, followed by powders in boxes which were disposed of by only 0.8% of the respondents.
- ◆ Among those who had disposed of products, two-thirds (67%) disposed of the product by leaving it in the container and putting it into the trash, while 10% poured the product down the drain or the toilet. Looking at this by the total sample, 5.3% of the households in the study disposed of a product by putting the product and container together in the trash. No other disposal method was used by more than 1.0% of the total sample. Only 3 households among the 13,697 surveyed disposed of a product by pouring it outside on the ground or in a storm sewer.
 - ◆ While all products were most likely to be disposed of in their containers and put into the trash, there were some differences by product form. Liquids in bottles were more likely to be poured down the drain/toilet, while other products, such as solids, aerosols and gels, were more likely to be disposed of in the container.
- ◆ One interesting way to examine the data is to compare the percentage of households who disposed of any container with those who disposed of an unused product as well. (See table on following page.) This holds constant the incidence of usage of a product category and the use-up rate of the product. Examining the data in this fashion, the relationship of households disposing of unused product to those disposing of any container can be seen.
 - ◆ This percentage ranges from a low of 1.8% for chlorine bleach to a high of 9.9% for starch.
 - ◆ The products which had a particularly high incidence of product disposal relative to container disposal include: starch (9.9%), oven cleaner (9.4%), metal cleaner/polish (7.5%), film/spot remover (5.6%), and scouring cleanser (5.1%).
 - ◆ Those with a relatively low incidence of product disposal compared with container disposal are: chlorine bleach (1.8%), water softener (1.9%), detergent booster (2.2%), and color-safe bleach (2.2%).
- ◆ Additional tables which follow show demographic information for households which disposed of unused products by specific product category.

ABOUT CLEANING PRODUCTS IN YOUR HOME

This page is about cleaning products you may have had in your home in the past 3 months. For each product listed below, we would like to know:

- 1a) If you DISPOSED OF any partially full or empty containers of this product in the past 3 months.
- 1b) If there was AN UNUSED AMOUNT OF PRODUCT (more than a trace) left in the container when you disposed of it. (IF "YES", ANSWER Q.1c AND Q.1d)
- 1c) HOW you disposed of the PRODUCT (not the container). (Insert Code #)
- 1d) What the FORM of the product was. (Insert Code #)

PLEASE ANSWER THE QUESTIONS IN COLUMNS 1a, 1b, 1c AND 1d FOR EACH CLEANING PRODUCT BELOW:

CLEANING PRODUCTS	1a Did You DISPOSE OF Any Partially Full or Empty Containers Of This Product In The Past 3 MONTHS?		1b Did The Container Have AN UNUSED AMOUNT Of Product Left When You Disposed Of It?		1c How Did You Dispose Of The PRODUCT Itself? (USE CODE LIST C)	1d What Was The FORM Of The Product You Disposed? (USE CODE LIST D)

Dear Mike,

Thank you for giving SDA an opportunity to comment on the Instructional Module - "Household Products" which is part of the *Healthy Indoor Air for America's Homes* program. We have one overriding comment and suggestion. The remainder of our comments are included on the attached pages.

We question the focus placed on water-soluble cleaning products throughout this program. Because these products are intended to be used in water solutions, the VOCs (predominantly ethanol) used in them are those which have a high affinity for water (i.e., low Henry's Law constant). The products, including most of the VOCs, go down-the-drain after use or during disposal. For example, SDA-sponsored research has shown that only 0.4 and 4 percent of the ethanol used in laundry and hand dishwashing detergents, respectively, is actually emitted into the atmosphere as a result of typical consumer use of these products^{1,2}. Emissions during product use and after disposal were accounted for in this research. Further, the industry's focus on the use of organic compounds which are biodegradable results in these substances being broken down before being emitted.

Because water-soluble cleaning products release negligible amounts of VOCs into the home, we request that references to these products be removed from the script and transparencies. We understand that consumers do have questions about cleaning products, since they are prevalent in our homes and do have noticeable fragrances. If you feel it is important to address these products in the program, we suggest doing one script and transparency on the subject. Our proposal for the script/transparency is as follows:

Some products, such as cleaning products, can be identified by their fragrances. Are these products a problem?

Fragrance is not necessarily an indication of VOC problems. For example, even though many water-soluble cleaning products have noticeable fragrances, the fragrance is a very small part of the product formulation. Because water-soluble cleaning products need to work and stay in water to do their job, the VOCs that are used in them are attracted to and stay in the water solutions. After they have done their cleaning job, the product, including the VOCs, go down-the-drain and are safely treated in sewage treatment facilities.

Negligible amounts of the VOC content of cleaning products which are disposed into wastewater treatment systems, such as laundry detergents, dishwashing detergents and many hard surface cleaners are actually emitted. Because these products are generally intended to be used in water solutions, VOCs which have a high affinity for water (i.e., low Henry's Law constant) tend to be used. If VOCs having a low affinity for water were used, the performance of the product would vary as the VOCs were emitted from the product or wash solution. Therefore, the potential emissions of VOCs from a cleaning products are dependent on the use conditions of the product, how it is disposed, and the VOC's physical, chemical and biological attributes.

For example, SDA-sponsored research has shown that only 0.4 and 4 percent of the ethanol used in laundry and hand dishwashing detergents, respectively, is actually emitted into the atmosphere as a result of typical consumer use of these products^{1,2}. Emissions during product use and after disposal were accounted for in this research. Ethanol is the predominant VOC used in these products.
